

Your robots are working. Is your business?

Robot telemetry, turned into financial telemetry, cash flow, and default risk, weeks before it hits a bank statement.

Two different clocks

THE ROBOT'S CLOCK

Continuous. Every trip, fault, charge cycle and idle hour is logged the moment it happens.

THE BUSINESS'S CLOCK

Monthly, in arrears. The operator and the lender learn about a shortfall after the money has already moved.

Every hardware-financed category eventually grows an underwriting layer. Robotics is the last large category still without one.

WHY NOW

Nov 2025

ISO standard for service robot data published, the interoperable schema this category never had

~20%

RaaS market CAGR through 2030, growing faster than the underwriting layer for it

85%+

Telematics adoption in lender-financed vehicle fleets, the same covenant playbook, one asset class earlier

Telemetry, translated into cash flow

01

Robot telemetry

Utilization, uptime, fault codes and location, pulled by API from the fleet the operator already runs.

02

Financial telemetry

Each unit's activity converted into a leading signal of financial health: falling utilization today is churn, an SLA credit, or a missed renewal tomorrow.

03

Cash flow analysis & projection

Fleet-level inflow and outflow, projected forward from live utilization rather than last month's close.

04

Default & credit risk

A shortfall surfaced weeks early, for the operator making payroll and the lender holding the paper.

A small, reachable wedge inside a large financed base

SOM is the three-year reachable band, deliberately narrow: first customers are named accounts, not a funnel. Two sizing approaches, sharing some inputs, land in the same ~\$280-300M range.

Under the elevated-adoption case (~32% CAGR), this ceiling scales toward ~\$1.97M ARR by Year 3, page 5.

SOURCED INPUT	VALUE
Global service robot installed base	475K-710K
RaaS market size, 2025 (high-cluster est.)	\$26.7-33.6B
RaaS market CAGR through 2030 (base · elevated-adoption, Barclays physical-AI)	~18-21% · ~32%
RaaS share of installed base (assumption, informed by Seegrid's 70% RaaS-structured 2025 contracts)	30-50%
Software / analytics attach rate (assumption)	~1% of RaaS rev.
Fee per robot / yr, blended across tiers (page 5)	\$1,200
TAM, bottom-up (robots × fee) · top-down (market \$ × attach rate)	~\$283M · ~\$300M

One formula, three ways to buy

Individual operator

SELF-SERVE

1–2 robots, single location · \$25/mo floor

RaaS operator

SALES-ASSISTED

Fleet across one or more sites · ~12% financed / ~5% owned

Enterprise

DIRECT, NEGOTIATED

Thousands of robots, multi-site chains · graduates to ~\$200–300/mo

FORMULA	RATE	WORKED EXAMPLE
Financed / leased / on a loan	~12% of pmt.	\$399/mo → ~\$48/mo
Owned outright	~5% / yr of value	\$11,990 → ~\$50/mo
Enterprise, financed	~12% of pmt.	\$2,000/mo → ~\$240/mo

MODELED REVENUE RAMP (ARR), BOOTSTRAP VS. FUNDED PACE

— Bootstrap · part-time founders — Funded · full-time + 1 engineer + 2 interns

Bootstrap: two founders, part-time around school and jobs, the deck’s original pace, reaching the \$0.7–2.25M SOM ceiling (page 4) by month 36. Funded: full-time founders plus one below-market engineer hire and two paid interns (page 12), same milestones at roughly 2x the pace, reaching the ceiling by month 24. Both assumption-driven, not committed revenue or a forecast.

Why this is hard to copy

Directional positioning from public product pages, not a formal analyst matrix.

Contractual, not scraped Access comes from a loan or lease covenant. A dashboard clone still needs the relationship.	Cross-brand normalization No OEM will show a lender how its failure rate compares to a rival's.								
Written into the paperwork Once it sits in a borrowing base formula, removing it means renegotiating a portfolio.	Financial, not operational Incumbents stop at fleet health, not cash flow and credit risk.								
<table><tr><th>REGULATORY GROUNDING</th><th>STATUS</th></tr><tr><td>ISO standard for service robot data</td><td>Nov 2025</td></tr><tr><td>Lender-financed vehicle telematics precedent</td><td>85%+</td></tr><tr><td>Equipment-finance covenant practice</td><td>Established</td></tr></table>		REGULATORY GROUNDING	STATUS	ISO standard for service robot data	Nov 2025	Lender-financed vehicle telematics precedent	85%+	Equipment-finance covenant practice	Established

Real hurdles, and what each one opens up

Is robot adoption growing fast enough to matter?

\$16.7B

Global robot install value, an all-time high. RaaS growing ~18–21% CAGR, already accelerating toward ~32% under an elevated-adoption case (page 4).

→ Pulls the lender-expansion product forward sooner than modeled.

Will operators actually pay for this?

~12%

Of financing payment, not a flat SaaS fee (page 5). One caught at-risk robot covers years of it at these prices.

→ Paying usage history is what makes the lender-data product credible later.

What if manufacturers never grant real access?

85%+

Vehicle telematics adoption once lenders required it, the exact mechanism this is built on. Phase 0 proves it first (page 10), before anything else is built.

→ One access relationship becomes the template for manufacturer partnerships.

Can a two-person team execute this?

2 → 5

Founders today. Funded pace adds one below-market engineer and two paid interns (page 12), a staged build, not a stretch.

→ Same lean, staged model scales the team again at seed.

Three tracks in flight

No businesses signed today. Working demo built on sample data, live telemetry access still unproven (page 10), pilot actively being sourced, no signed pilot, customers, or revenue yet.

RaaS operators · primary

Manufacturers

Lenders · secondary

WHERE IT STANDS	NEXT STEP
RaaS operators. Karl Barry, Formic Technologies, email drafted. Their upstream lender, Mitsubishi HC Capital, also confirmed.	Send, close pilot
Manufacturers. Lei Yang, CEO & Co-Founder, IntBot, met in person, first outreach sent.	API access, one brand
Lenders. Stephen Leege, Chief Credit Officer, Financial Pacific Leasing, confirmed strongest contact.	Held, expansion layer

Two founders, one thesis

Credit risk on one side, hands-on GTM building on the other: the two instincts a product sitting between a robot's API and a lender's borrowing base actually needs.

Antonio D'Angelo

CO-FOUNDER · CEO

Builds LLM-based go-to-market automation as a RevOps & GTM analyst at Parsec Automation, with prior VC experience evaluating early-stage deals at Sunset Ventures. Covers credit and rate risk as a fixed income analyst at Titan Capital Management. Brings the GTM and underwriting instincts Botlien sells to.

Samuel Kim

CO-FOUNDER · CTO

Currently implementing AI algorithms in a financial context at Metro City Bank. Studies finance at Cal State Fullerton, fixed income analyst at Titan Capital Management, pursuing CFA Level I. Prior computer science background.

Six months bootstrap, three months funded, four phases

PACE, STATED HONESTLY

Bootstrap is two founders, part-time around school and existing jobs, weeks as sequencing, not hard deadlines. Funded is both founders full-time plus one below-market engineer hire and two paid interns, funding buys pace, not a different plan. Full team and cost breakdown on page 12.

WHY THIS ORDER

Access before product

Telemetry access is the riskiest unknown, so it gets proven first, before more is built on top of it.

Real use before scale

One operator running it for real outweighs a second brand or a bigger fleet at this stage.

Raise on data, not deck

Fund outreach starts once pilot data exists to replace the projections in this deck.

\$500K

pre-seed · ~34.6 months of runway at real burn

INSTRUMENT

Post-money SAFE, valuation cap, no discount, YC standard form

CAP & MINIMUM CHECK

Set once incorporation closes and early conversations calibrate the market

MILESTONES THIS ROUND FUNDS

Live telemetry feed

Contractual access works in practice, not just on paper.

Paying pilots

Operators will pay for early warning at the stated price.

One lender commitment, in writing

A lender agrees, even informally, to use telemetry in a covenant or borrowing base on a pilot.

WHY SIZED THIS WAY

The round is sized to reach one lender's written commitment, not to build a category. The extended runway is a deliberate safety margin, not overraising, telemetry access is a genuinely unproven relationship, and the real milestone could take longer than a best-case guess.

RUNWAY, REAL MATH

Month 0 Month 12 Month 24 Month 34.6, \$500K runs out Mo 36

Full team plan, cost breakdown, and the runway at every check size from \$100K to \$500K, page 12.

Use of funds & runway, the real math

THE TEAM THIS FUNDS

Neither founder takes salary today. Funding buys full-time focus, not a payroll line, plus one below-market engineer hire and two paid interns, real wages, not free labor, California minimum wage applies to real productive work.

LINE ITEM	MONTHLY
Antonio, living draw	\$2,900
Samuel, living draw	\$2,900
Founding engineer, below-market + equity	\$5,833
Interns × 2, ~17.5 hrs/wk @ \$18/hr	\$2,730
Tools, Hostinger + domain + Claude Max ×2	\$204
Infra, Cloudflare + Supabase, \$0 through Phase 2	\$0-\$30
Legal / incorporation, one-time	\$500 + \$450 + \$100
Steady-state total	~\$14.4K/mo

Telemetry access modeled at \$0, an open assumption, not a committed cost.

RUNWAY AT EVERY CHECK SIZE

Roughly linear, about 3.5 months of runway per additional \$50K, since burn is nearly flat month to month. Two open numbers still to confirm: exact engineer base (\$60K-80K range, \$70K modeled) and exact intern hourly rate (\$16.90-20/hr range, \$18 modeled).
