

# Robochestra

*A simple, cross-brand workflow layer that lets a small business coordinate different types of humanoid robots, cleaning, greeting, moving, stocking, in one sequence through a single interface. Working name, not finalized.*

---

## THE PROBLEM

Small businesses interested in humanoid robots today face a fragmented landscape: single-function robots, brand-specific control apps, and no way to coordinate multiple robot types doing different jobs in one place. Enterprise-grade orchestration platforms already exist, but they are built for large warehouses and 3PLs with dedicated integration teams, not for a small business running a few robots.

## THE SOLUTION

Robochestra is one simple, visual interface to connect and sequence humanoid robots regardless of brand or function, the same idea as Sonos for multi-room audio, or n8n for software workflows, applied to physical labor. A business owner should be able to say, in effect, "when the store opens, greet customers, then start cleaning the floor, then restock shelves at 2pm," and have it just work across whatever robots are on hand.

## WHY NOW

- **Commercial proof:** Ultra Robotics' humanoids filled 30% of Highline Commerce's e-commerce orders in Brooklyn as of July 2026, the first verified mid-market deployment outside Amazon and automotive.
- **Capital acceleration:** \$8.6B was invested into humanoid robotics startups in the first half of 2026 alone, already 1.8x all of 2025.
- **Standardization:** ISO 21423, the first multi-vendor robotics interoperability standard, is drafting for publication this year.
- **Falling price floor:** Robots-as-a-Service pricing has reached \$8-15/hr, materially closer to what a small business could realistically afford.

## THE GAP

Enterprise fleet orchestration platforms (SapienO, KinetIQ, InOrbit.AI) target large warehouses with dedicated operations teams. Home hubs (HouseBots) target consumers and homeowners. Nobody found in this research is building the simple, small-business-focused, cross-function version, the specific lane Robochestra would occupy.

## TEAM

- **Antonio D'Angelo, GTM/Business:** CSUF senior finance major. Fixed income analyst at Titan Capital Management, equity analyst on CSUF's Student Managed Investment Fund, RevOps/GTM analyst at Parsec Automation building LLM-based go-to-market automation, prior VC analyst

experience at Sunset Ventures.

- **Samuel Kim, CTO:** Building the backend. Technical scope and robotics-specific experience still to be fully defined.

## CURRENT ASSESSMENT

**Composite: 5.4 / 10 - real timing, unproven team and market readiness**

|                              |             |                                                                                                                 |
|------------------------------|-------------|-----------------------------------------------------------------------------------------------------------------|
| <b>Market timing</b>         | <b>6/10</b> | Humanoid deployment just crossed from pilot to real commercial production; the SMB hardware base is still tiny. |
| <b>Competitive moat</b>      | <b>6/10</b> | The broad orchestration category is crowded; the SMB angle specifically has no direct competitor found yet.     |
| <b>Target market size</b>    | <b>4/10</b> | Real deployment today is concentrated in large 3PLs and enterprises, not small businesses, yet.                 |
| <b>Execution feasibility</b> | <b>4/10</b> | Two-person team; robotics protocol and hardware-safety engineering is a high technical bar.                     |
| <b>Urgency / why now</b>     | <b>7/10</b> | Capital and commercial proof points are accelerating fast across the category.                                  |

## NEXT STEPS

- **1.** Build a working prototype of the core workflow canvas, even scoped to one function and one robot API, to have something real to demo.
- **2.** Secure one real design-partner conversation with a small business or robotics company, proof beats a pitch.
- **3.** Clarify Samuel's technical scope and robotics-specific experience explicitly, since this is the single largest open question for any future investor conversation.
- **4.** If pursuing capital, target early-stage, robotics/physical-AI-focused funds that write pre-product checks, not the larger multi-stage firms already in the broader outreach list.

---

*This brief reflects working research and judgment from a single session, not formal market diligence. Treat figures and competitive claims as directional and re-verify before using them in an external pitch.*
